Project Design Phase

Problem – Solution Fit

Date	1 October 2026
Team ID	SWTID-2026-9874
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Problem – Solution Fit

This canvas connects the Service Desk Agent's Incident-management problem with the proposed ServiceNow solution. It explains the user, problem, root cause, existing behaviour, triggers, solution, and channels through which the solution is used.

Original Skill Valet Problem–Solution Fit canvas retained for reference.

Editable Problem–Solution Fit Content

1. CUSTOMER SEGMENTS

Service Desk Agents / IT Support Agents who create, assign, update, and submit ServiceNow Incident records.

Fit: Primary users who interact directly with the Incident form and list.

2. JOBS-TO-BE-DONE / PROBLEMS

Create complete Incident records, classify Impact and Urgency correctly, assign Incidents, update State, and submit records without data-entry errors.

Fit: The current problem is incomplete, inconsistent, or incorrect Incident information caused by manual entry and limited validation.

3. TRIGGERS

A new Incident is created; Impact is changed to High; an Incident is submitted; a user attempts to edit State from the Incident list.

Fit: These events trigger the UI Policy or the appropriate Client Script behavior.

4. CUSTOMER BEFORE / AFTER

Before: users rely on manual checking and may leave fields incomplete or change important values incorrectly.
After: the system automatically controls fields, validates submission, updates Urgency, and restricts list-based State changes.

Fit: The desired change is more consistent Incident data entry with immediate feedback.

5. CUSTOMER CONSTRAINTS

Users need to work quickly; they may overlook required information; they may not know every business rule; Incident handling should remain simple and should not require extra tools or external services.

Fit: The solution therefore uses native ServiceNow controls at the point where the user is entering data.

6. PROBLEM ROOT CAUSE

Incident data-entry rules are not fully enforced through manual entry alone. Important fields can be incomplete or changed without the required validation.

Fit: The root cause is dependence on manual user checking for rules that can be enforced dynamically at the interface.

7. BEHAVIOUR

Agents enter Incident information, select Impact/Urgency, assign users/groups, submit records, and may update State from either the form or list.

Fit: The solution targets these existing behaviours rather than requiring a separate workflow.

8. AVAILABLE SOLUTIONS

Manual checking, user instructions, basic form configuration, and existing ServiceNow field controls can help, but they do not cover all required conditional validation and list-edit restrictions in the project scope.

Fit: The project adds targeted UI Policies and Client Scripts to close these gaps.

9. YOUR SOLUTION

Implement a High Impact UI Policy with UI Policy Actions plus onChange, onSubmit, and onCellEdit Client Scripts. Assignment Group becomes mandatory and Urgency becomes read-only for High Impact; Urgency is automatically set to High; missing Assigned To blocks submission; direct State list editing is prevented.

Fit: This directly addresses the identified Incident data-quality problems using native ServiceNow functionality.

10. CHANNELS OF BEHAVIOUR

ServiceNow Incident form and Incident list view accessed through the web browser.

Fit: The controls appear directly in the user's existing Incident-management workflow, so no separate application is required.

Problem–Solution Fit Summary

Problem	Solution Fit
Incomplete or incorrect Incident information	Conditional UI Policies and Client Scripts enforce the required behavior.
Incorrect handling of High Impact Incidents	High Impact condition controls Assignment Group and Urgency.
Missing Assigned To during submission	onSubmit validation prevents saving until the requirement is satisfied.
Unauthorized State list editing	onCellEdit prevents direct list changes while form updates remain possible.
Manual checking and inconsistent rules	Automated client-side controls provide immediate, consistent feedback.

Conclusion: The proposed ServiceNow UI Policy and Client Script solution directly addresses the Incident data-entry and validation problems identified in Phase 1. It fits the existing Service Desk workflow and uses native platform controls rather than requiring a separate application.
