Project Design Phase

Proposed Solution

Date	1 October 2026
Team ID	SWTID-2026-9874
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template

The following proposed solution directly addresses the Service Desk Agent and IT Support Agent problems identified during the Ideation Phase. It uses native ServiceNow Incident configuration to improve data accuracy and enforce the required Incident handling rules.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Service Desk Agents need to create complete and accurate Incident records, but important Incident fields may be left incomplete or entered incorrectly because Incident data entry depends on manual checking and user awareness. High Impact Incidents may also be handled inconsistently without appropriate validation.
2	Idea / Solution description	Implement a High Impact UI Policy and Client Scripts in ServiceNow Incident Management. When Impact is High, Assignment Group becomes mandatory and Urgency becomes readonly. An onChange Client Script automatically sets Urgency to High. An onSubmit Client Script prevents saving a High Impact Incident when Assigned To is empty. An onCellEdit Client Script prevents direct State changes through list editing while allowing State changes from the Incident form.
3	Novelty / Uniqueness	The solution combines conditional UI control and event-based Client Scripts to address different Incident data-entry situations in one lightweight workflow. It uses the existing ServiceNow Incident interface rather than requiring a separate application, while distinguishing form changes, submission validation, and list editing.
4	Social Impact / Customer Satisfaction	The solution reduces avoidable data-entry errors for Service Desk and IT Support users, provides immediate guidance and validation, and promotes more consistent handling of High Impact Incidents. This can improve user confidence, Incident data quality, and the consistency of support operations.
5	Business Model (Revenue Model)	The solution is primarily an internal ServiceNow process-improvement solution rather than a standalone revenue-generating product. Its business value comes from reducing manual validation effort, preventing incorrect Incident records, and improving support workflow efficiency. The same approach could also be delivered as a ServiceNow configuration/customization service for organizations.
6	Scalability of the Solution	The solution can be extended within the ServiceNow platform by adding further UI Policies, Client Scripts, validation rules, and Incident workflows as business requirements grow. Because it uses platform-native controls and does not require a separate application server or external API, additional Incident rules can be added incrementally.

Solution-to-Problem Alignment

Important Incident fields may be incomplete.	Assignment Group is made mandatory for High Impact Incidents.
Urgency may be entered inconsistently.	Urgency is automatically set to High and made read-only for High Impact.
High Impact Incident may be submitted without Assigned To.	onSubmit Client Script blocks submission when Assigned To is missing.
State can be changed directly from list editing.	onCellEdit Client Script prevents direct list-based State changes.
Manual checking can lead to inconsistent handling.	UI Policies and Client Scripts apply defined rules automatically.

Conclusion: The proposed solution fits the identified customer problem by moving important Incident validation and fieldcontrol rules from manual checking into the ServiceNow interface. It directly supports the project's objective of improving Incident data integrity.
