Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	1 October 2026
Team ID	SWTID-2026-9874
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Functional Requirements

The following functional requirements define what the ServiceNow Incident solution must do to enforce consistent and accurate Incident data entry.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Incident Record Creation	Create and submit Incident records through the ServiceNow Incident form.
FR-2	High Impact Control	When Impact is High, make Assignment Group mandatory and apply the configured High Impact UI Policy.
FR-3	Urgency Field Control	When Impact is High, make Urgency read-only; when the condition becomes false, restore editability.
FR-4	Automatic Urgency Update	When Impact changes to High, automatically set Urgency to High using an onChange Client Script.
FR-5	Save-Time Validation	Prevent submission of a High Impact Incident when Assigned To is empty and display a clear validation message.
FR-6	List Edit State Control	Prevent direct State changes through Incident list editing while allowing State changes from the Incident form.
FR-7	Reverse Condition Handling	When Impact changes from High to another value, reverse the applicable UI Policy field controls.
FR-8	Incident Validation Testing	Support verification of mandatory enforcement, successful save, reverse condition, list edit blocking, and form-based State update.

Non-functional Requirements

The following non-functional requirements describe the expected quality characteristics of the Incident UI Policy and Client Script solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Incident form controls should be clear and easy for Service Desk Agents to understand. Validation messages should clearly identify what needs to be corrected.
NFR-2	Security	Client-side controls should restrict unauthorized list-based State changes and enforce the defined Incident field rules at the user interface.
NFR-3	Reliability	UI Policies and Client Scripts should behave consistently whenever their configured conditions are met and should correctly reverse applicable controls when conditions are false.
NFR-4	Performance	Client-side controls should execute quickly during field changes, form submission, and list editing without unnecessary processing or noticeable delay.
NFR-5	Availability	The configured Incident controls should be available whenever users access the ServiceNow Incident form and list views under the normal ServiceNow environment.
NFR-6	Scalability	The solution should remain lightweight and maintainable as additional Incident validation rules or UI controls are added in the future.

Requirement Traceability

Project Element	Covered Requirement(s)
High Impact UI Policy	FR-2, FR-3, FR-7
onChange Client Script	FR-4
onSubmit Client Script	FR-5
onCellEdit Client Script	FR-6
Testing activities	FR-8
User-friendly validation	NFR-1
List-edit restriction	NFR-2
Consistent rule/reverse behavior	NFR-3
Lightweight client-side execution	NFR-4, NFR-6

Scope note: These requirements are specific to the supplied project, Implement Client Script & UI Policy (Incident), and replace the sample registration requirements shown in the original template.
