Project Development Phase

User Acceptance Testing (UAT) – Functional Specification Document

Date	1 October 2026
Team ID	SWTID-2026-9874
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	
Project Version	Version 1.0
Testing Period	1 October 2026 – 1 October 2026

1. Project Overview

Item	Details
Project Name	Implement Client Script & UI Policy (Incident)
Project Description	A ServiceNow Incident-management configuration that uses a High Impact UI Policy and Client Scripts to improve Incident data integrity. The solution makes Assignment Group mandatory and Urgency read-only for High Impact Incidents, automatically sets Urgency to High, prevents submission when Assigned To is missing, and prevents direct State changes through list editing while allowing State changes from the form.
Project Version	1.0
Testing Period	1 October 2026 – 1 October 2026

2. Testing Scope

The UAT covers the user-facing Incident controls described in the project requirements and implementation documents. The scope is limited to native ServiceNow Incident functionality.

- High Impact UI Policy and its field behavior.
- Automatic Urgency update through the onChange Client Script.
- Submission validation through the onSubmit Client Script.
- Reverse behavior when Impact changes from High to Medium.
- State-change restriction through the onCellEdit Client Script.
- Normal State update through the Incident form.

Requirements covered: High Impact UI Policy, onChange Client Script, onSubmit Client Script, onCellEdit Client Script, testing activities, user-friendly validation, list-edit restriction, reverse behavior and lightweight client-side execution.

3. Testing Environment

Environment Item	Details
URL / Location	ServiceNow Development Instance – Incident module
Application Area	ServiceNow Incident Management
Access	Authenticated ServiceNow development/configuration user
Browser	Web browser
Credentials	Not included in the document for security reasons
External API	None required

4. UAT Acceptance Criteria

- When Impact is High, Assignment Group is mandatory.
- When Impact is High, Urgency is controlled according to the configured UI Policy and is automatically set to High.
- A High Impact Incident with an empty Assigned To field cannot be submitted.
- A High Impact Incident with Assigned To populated can be saved.
- Changing Impact from High to Medium reverses the applicable mandatory/read-only behavior.
- Direct State editing from the Incident list is blocked with the configured alert.

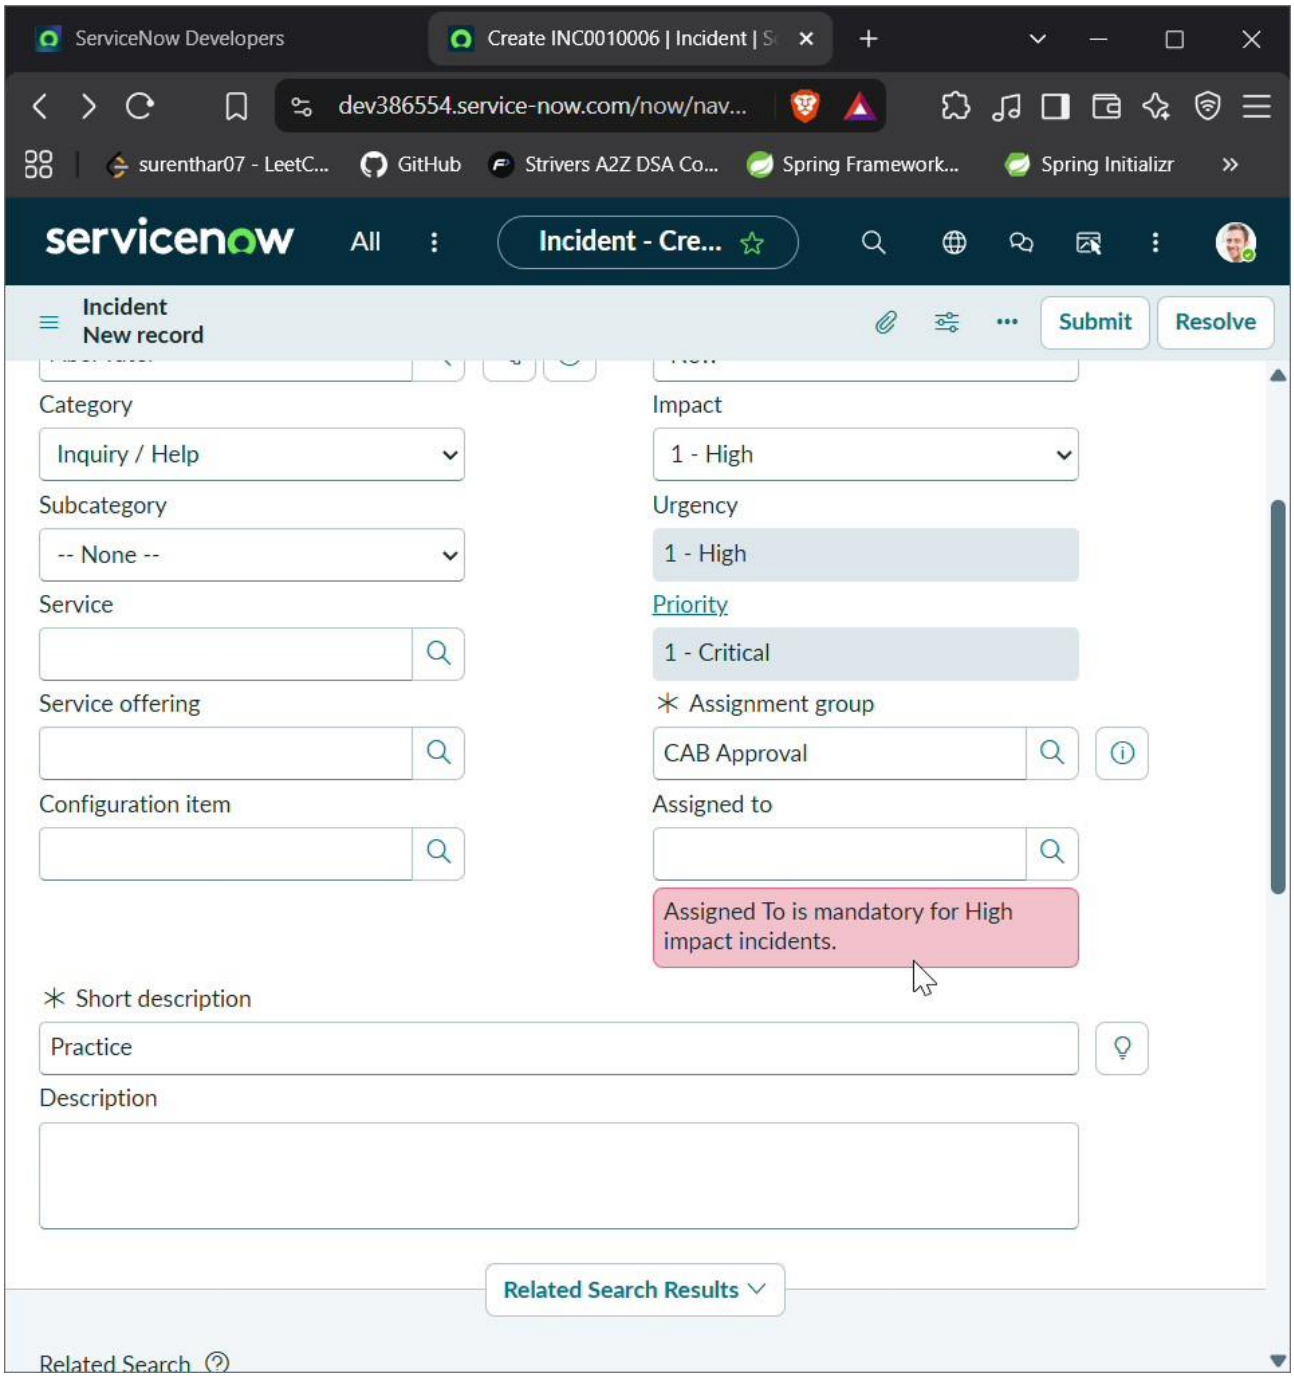

- State can be changed and saved from the Incident form.

5. UAT Test Cases

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Mandatory enforcement for High Impact Incident	1. Open Incident → Create New. 2. Set Impact = 1 - High. 3. Leave Assigned To empty. 4. Click Submit.	Incident must not be saved. The Assigned To validation message must be displayed. High Impact field controls must be active.	The Incident remained unsaved and the message “Assigned To is mandatory for High impact incidents.” was displayed. Impact was High and Urgency was automatically High.	PASS
TC-002	Successful save when Assigned To is provided	1. Open/Create an Incident. 2. Set Impact = 1 - High. 3. Select a valid Assigned To user. 4. Click Submit.	The Incident should save successfully without the missing Assigned To validation error.	Assigned To was populated with a valid user. Submit completed and Incident INC0010013 appeared in the Incident list, confirming that the record was saved.	PASS
TC-003	Reverse condition when Impact changes from High to Medium	1. Open an existing High Impact Incident. 2. Change Impact from 1 - High to 2 - Medium. 3. Check Assignment Group and Urgency behavior. 4. Update the record.	The High Impact UI Policy should reverse. Assignment Group should no longer be mandatory and Urgency should become editable. The record should save successfully.	Impact was changed to 2 - Medium. The High Impact field restrictions were reversed; Urgency was editable and Assignment Group was no longer under the High Impact mandatory condition. The record was updated successfully.	PASS
TC-004	Block direct State editing from Incident list	1. Open Incident → All. 2. Double-click/edit the State field directly in the list. 3. Attempt to save the list edit.	The State change must be blocked and the configured alert must appear. The direct list update must not be accepted.	The alert “State cannot be updated using list editing. Please open the Incident.” appeared while the list State edit was attempted.	PASS
TC-005	Allow State update from Incident form	1. Open an Incident record from the list. 2. Change State on the Incident form to Resolved. 3. Click Update. 4. Verify the saved record in the Incident list.	The State change should be accepted and saved from the form.	State was changed to Resolved from the Incident form. Update completed, and INC0010013 appeared in the list with State = Resolved. ServiceNow displayed “INC0010013 has been resolved.”	PASS

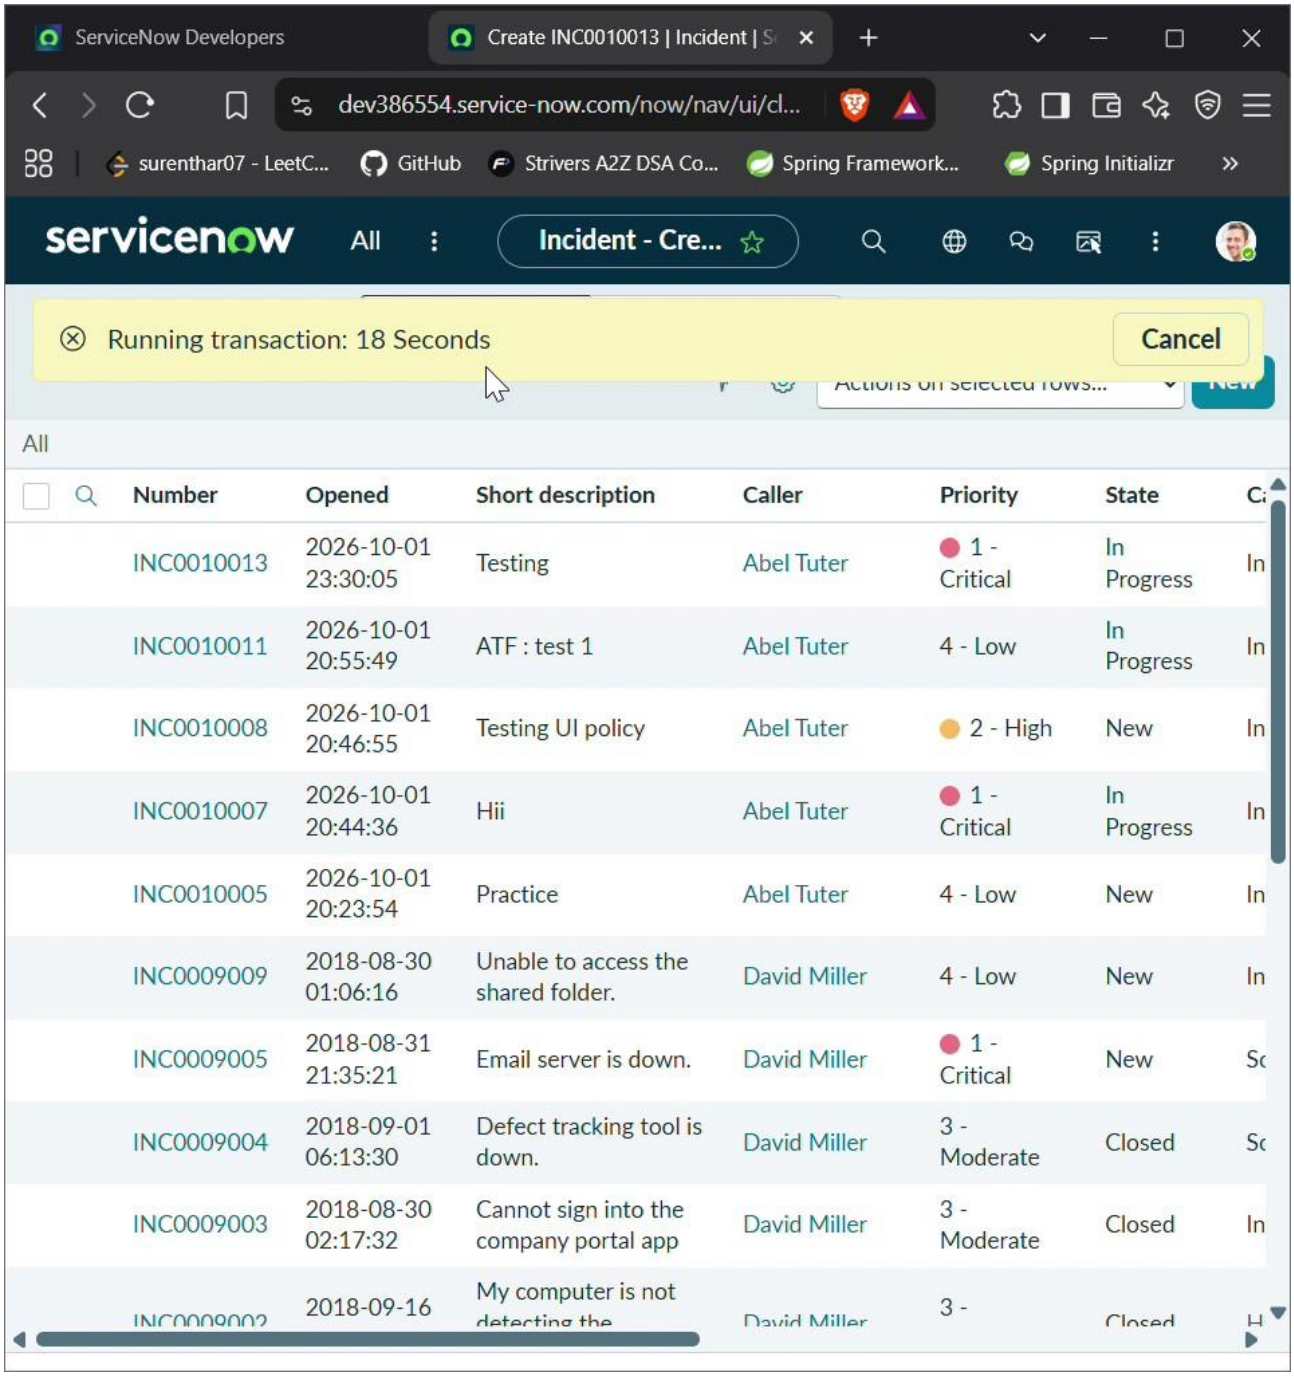

6. UAT Evidence

TC-001 – Mandatory enforcement for High Impact Incident

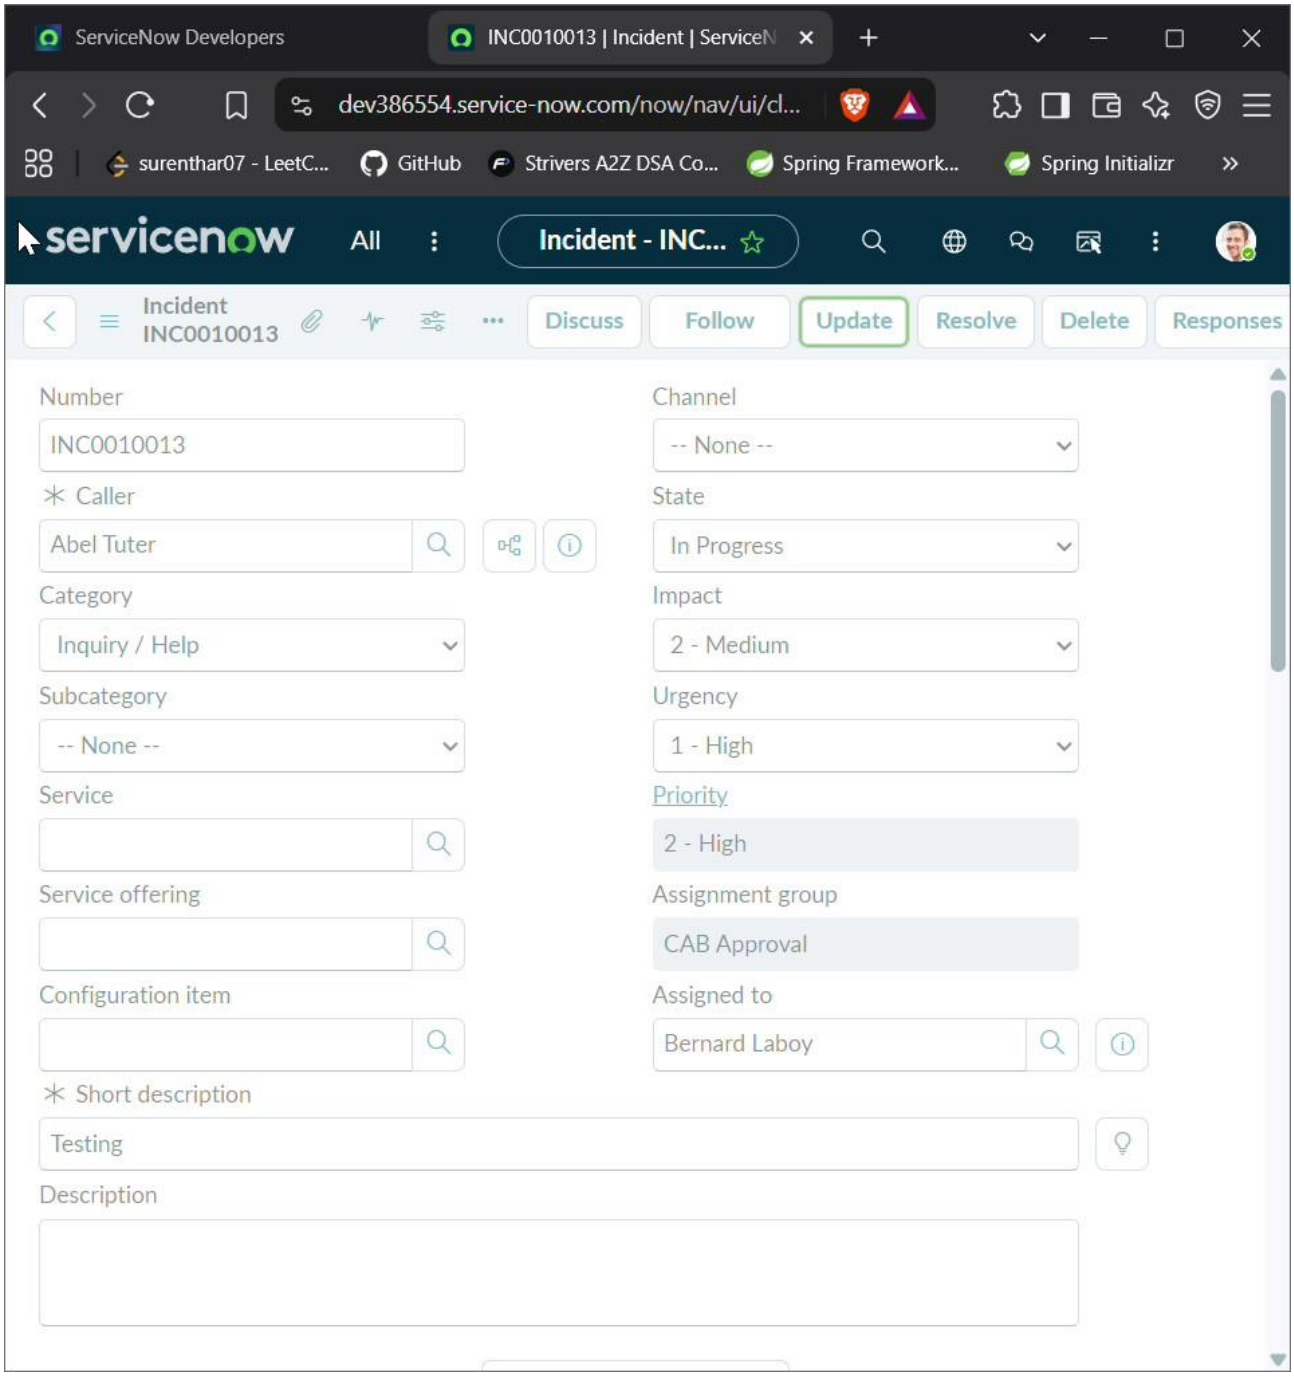

Evidence: UAT01.png

TC-002 – Successful save when Assigned To is provided

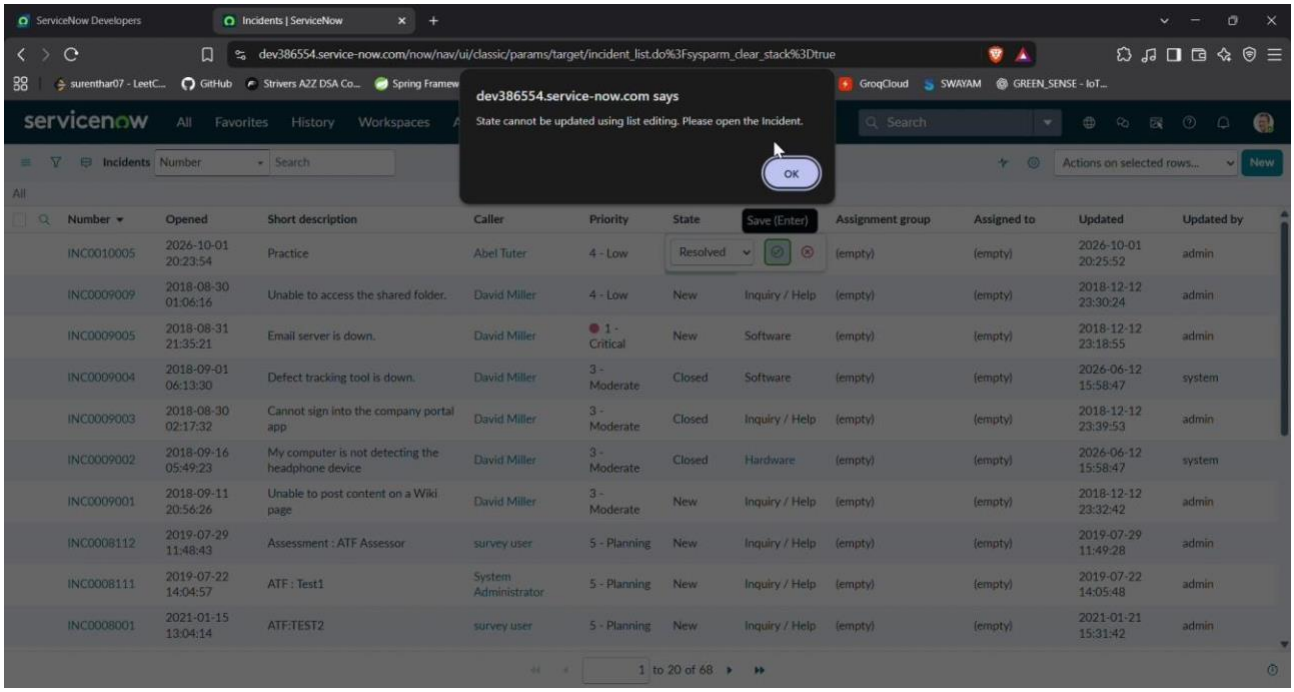

Evidence: UAT02.png

TC-003 – Reverse condition when Impact changes from High to Medium

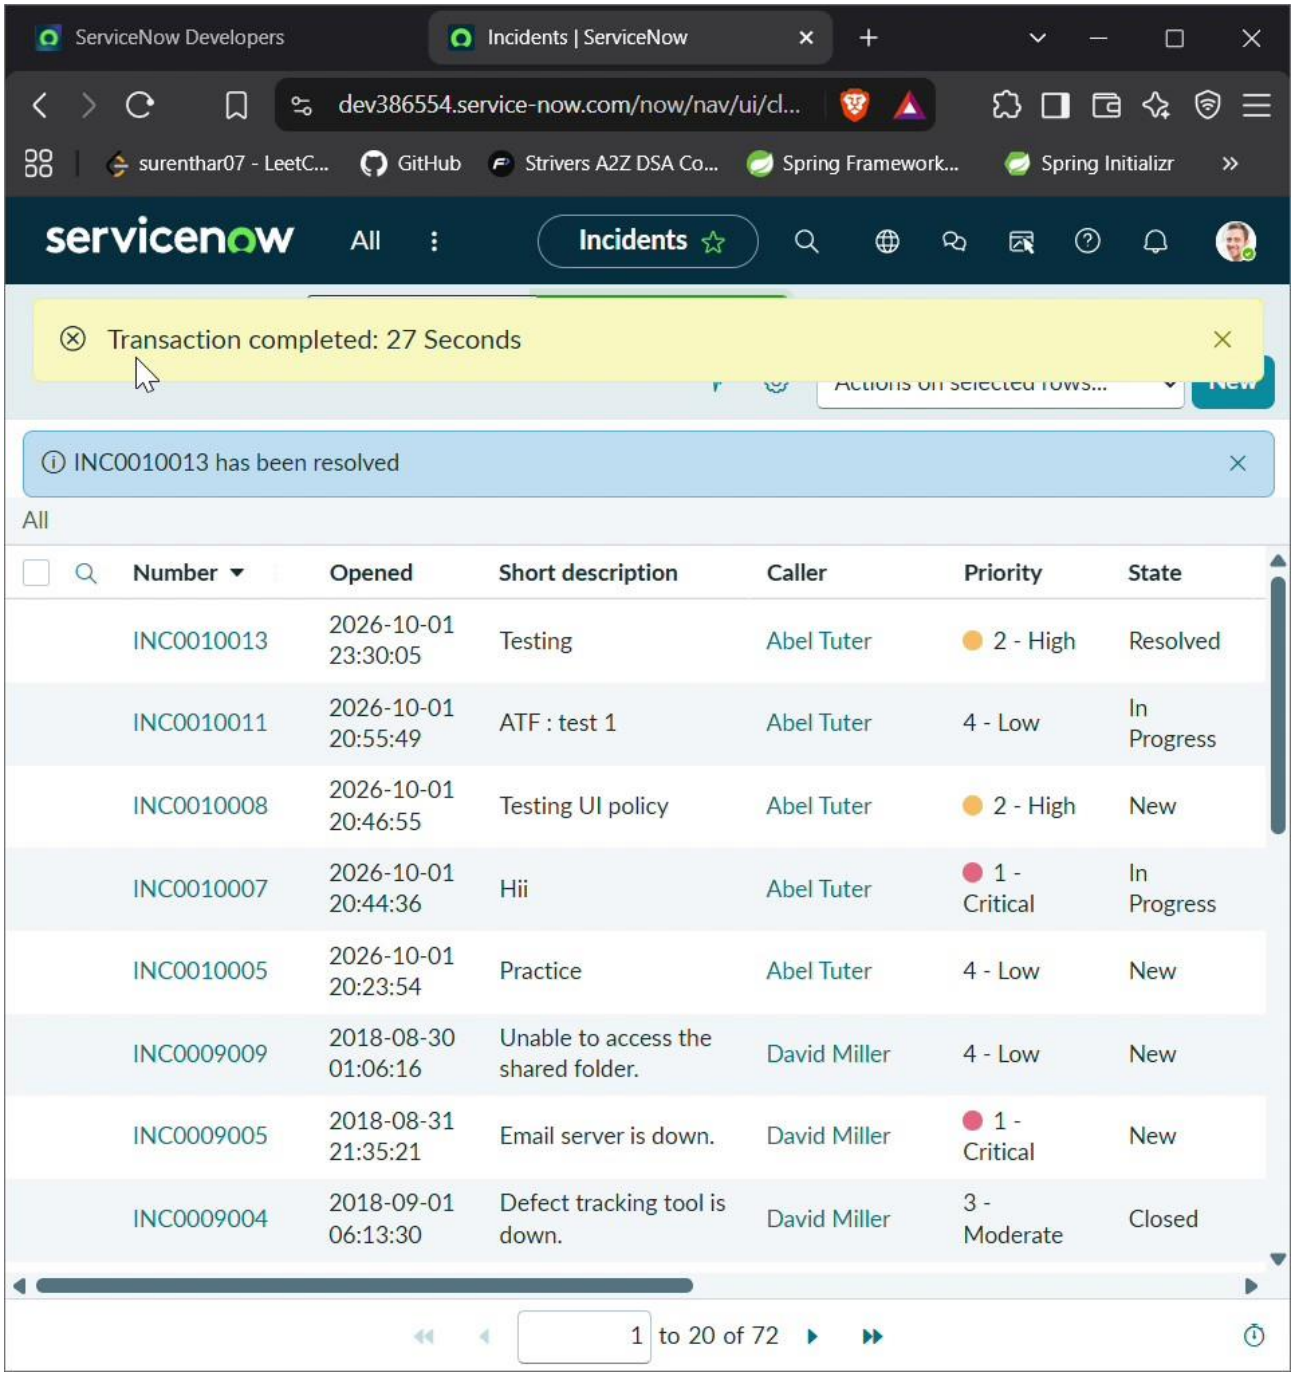

Evidence: UAT03.png

TC-004 – Block direct State editing from Incident list

Evidence: UAT04_alert.png

TC-005 – Allow State update from Incident form

Evidence: UAT05_final.png

7. Bug Tracking

No unresolved defects were identified in the five UAT scenarios executed for this project. The configured behavior matched the expected acceptance criteria in the supplied execution evidence.

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback
None	No UAT defect identified.	N/A	N/A	Closed / No open defect	No corrective action required for the five tested scenarios.

8. UAT Summary

Metric	Result	Details
Total UAT Test Cases	5	TC-001 to TC-005
Passed	5	All five tested scenarios passed.
Failed	0	No failed UAT case.
Blocked	0	No UAT case remained blocked.
Overall UAT Result	PASS	The tested ServiceNow Incident configuration met the defined UAT acceptance criteria.

9. Sign-off

The execution results indicate that the tested configuration satisfies the defined UAT scenarios. Formal sign-off must be completed by the authorized tester/project manager/product owner as required by the Skill Valet process.

Role	Name	Signature / Date
Tester	To be filled	To be filled
Project Manager / Mentor	To be filled	To be filled
Product Owner / Reviewer	To be filled	To be filled

10. Notes

- The UAT cases cover both negative scenarios (blocked/invalid actions) and positive scenarios (successful save/update).
- The project does not use an AI/ML model or external AI API; therefore AI model accuracy metrics are not part of this UAT document.
- The testing evidence is based on the supplied ServiceNow execution videos. The screenshots embedded in this document are representative frames extracted from those recordings.
- ServiceNow credentials are intentionally not recorded in this document.
- Reviewer and product-owner signatures must be completed by the authorized persons; they are not fabricated here.
